Excerpt: . . . expressions involving vector fields. Section 5 describes an algorithm for generating explicitly integrable flows associated with nilpotent Lie algebras. Section 6 exploits the relation between Taylor series and trees to study a class of intrinsic numerical integrators. We begin in Section 2 with some background. The results surveyed here are the work of a variety of mathematicians: especially want to mention the contributions of my collaborators Peter Crouch, Matthew Grayson and Richard Larson. The work on algebras of trees and its applications to symbolic computation is joint work with Richard Larson. All of the algorithms described here rest upon this foundation. The work on explicitly integrable flows and nilpotent Lie algebras is joint work with Matthew Grayson. The work on numerical algorithms evolving on groups is joint work with Peter Crouch.

2 Background Consider a differential equation $\dot{x}(t) = E_1(x(t)) + u E_2(x(t))$, $x(0) = x_0$ where E_1 and E_2 are vector fields and u is a parameter. In applications, u will be either a small perturbation $u = \epsilon$, a control $u = u(t)$, or simply the constant $u = 1$. Unless the vector fields E_1 and E_2 are very special, no algorithm is known which will return the general solution to the system in closed form. Our objective is to find efficient algorithms to compute various approximate solutions of the differential equation exactly using symbolic computation. Although the impact of symbolic computation in this area is recent, the connection between the existence of closed form solutions...
